Please make all measurements just as they are and we will allow space for clearance as needed.

The taper drop grate usually has about 2 inches before they drop very much, this allows enough room for the grate to clear the GISB flange .

A couple of pictures of the bottom of the grate and the inside of the catch basin with grate removed are very helpful !  
If you have the frame and grate size, please list it below:

Frame:  
 Grate:
